CryOmega® is superior to the cryosurgery canister with foam tips that I had been using previously. CryOmega is much easier to use, more precise and I am seeing far better results. Freeze times are also significantly shorter which makes me more apt to use cryotherapy for my pediatric patients. As a family medicine PA, CryOmega has become my choice for cryotherapy.

Kristen White, PA-C

Clinically effective direct spray of liquid nitrous oxide (-89°C/-127°F) in a convenient and economical device

Premier® Medical Products

I believe the CryOmega® device is appropriate for all Primary Care Physicians. It’s a great way to introduce cryosurgery for physicians who don’t realize how important full-time cryosurgery is for their practice.

John E. Hocutt Jr., M.D., FAAFP
CryOmega® - Multi-use disposable cryosurgical unit containing 16g nitrous oxide (N₂O) cartridge.

Effective
Continuous direct spray of liquid nitrous oxide (-89°C/-127°F) produces clinically effective freezing versus canister-based systems. Pinpoint precision prevents destruction of healthy tissue.

Convenient
Activate once and the device is ready for use. No time wasted on pre-procedure tip saturation, filling of cryogen reservoirs, etc. No additional accessories or cartridges needed. Simply aim and spray!

Economical
Each unit has 4 minutes (240 seconds) of total spray time and can be used for multiple procedures. Recommended spray times for treating each of the FDA-cleared lesions are provided below.

Disposable
Simply dispose of the entire unit with normal medical waste when the internal nitrous oxide cartridge is empty.

Hassle Free Activation

While holding the CryOmega® device with one hand, firmly grasp the knob at the end of the device with the other hand.

Firmly turn the knob clockwise one full rotation.

Make sure that the white dot on the knob aligns with the arrow on the device.

The device is now ready for use. Important: Do not turn the knob back. The device is now under pressure.

Firmly turn the knob clockwise one full rotation.

Achieving low temperatures is the key to clinically effective and successful cryosurgical application!
By delivering a continuous direct spray of nitrous oxide, CryOmega consistently produces the temperatures required to successfully treat warts, skin tags and other common benign skin lesions in any clinical setting.

Effective Temperature of Histofreeze® and Verruca Freeze®

Technique Tip:
During some procedures there may be a build-up of frost when using CryOmega. This frost can act as an insulator and prove beneficial in helping to maintain the desired temperature of the tissue. Room temperature and humidity, along with spray time, spray distance and spraying motion, play a role in frost build-up. Spray time is determined by the type and size of lesion treated. Recommended spray distance is approximately 1cm and should be applied in small circular motions.
